Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WITH MAPLA AND MAPLE PROTEINS. LC1, LC2 AND LC3, CAN ASSOCIATE WITH MAPLA AND MAPLE PROTEINS.

DOMAIN: Has a highly basic region with many copies of the sequence KKEE and KKEI/V, repeated but not at fixed intervals, which is responsible for the binding of MAPLE to microtubules. PTW: LC1 IS COEXPRESSED WITH MAPLE IT IS A POLYPEPTIDE GENERATED PROM MAPLE BY PROTECLYTIC PROCESSING. IT IS PREE TO ASSOCIATE WITH BOTH MAPLE INTERFACE WITH HAPLE AND MAPLE IN INTERFACE WITH MAPLE AND MAPLE IN INTERFACE WITH MAPLE AND MAPLE. FUNCTION: THE FUNCTION OF BRAIN MAPS IS ESSENTIALLY UNKNOWN.
PHOSPHORYLATED MAPIB MAY PLAY A ROLE IN THE CYTOSKELETAL CHANGES
THAT ACCOMPANY NEURITE EXTENSION. POSSIBLY MAPIB BINDS TO AT LEAST
TWO TUBULIN SUBUNITS IN THE POLYMER, AND THIS BRINGING OF SUBUNITS
MIGHT BE INVOLVED IN NUCLEATING MICROTUBULE POLYMERIZATION AND IN
STABILIZING MICROTUBULES.

DOMAIN: Has a highly basic region with many copies of the sequence KKEE and KKEI/V, repeated but not at fixed intervals, which is responsible for the binding of MAPIB to microtubules.

PIM: LC1 is coexpressed with MAPIB. It is a polypeptide generated from MAPIB by proteolytic processing. It is free to associate with both MAPIB and MAPIB. It interacts with the amino-terminal region of MAPIB (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TWO TUBULIN SUBUNITS IN THE POLYMER, AND THE MIGHT BE INVOLVED IN NUCLEATING MICROTUBULES STRBILIZING MICROTUBULES STRBILIZING MICROTUBULES SUBUNIT: 3 DIFFERENT LIGHT CHAINS, LC1, LC2

In dorsal root ganglia levels remain high throughout development.

-i- INDUCTION: By nerve growth factor.

-i- DOMAIN: Has a highly basic region with many copies of the sKKEE and KKEI/V, repeated but not at fixed intervals, which responsible for the binding of MAPIB to microtubules.

-i- PTM: LC1 is coexpressed with MAPIB. It is a polypeptide gen from MAPIB by proteolytic processing. It is free to associal both MAPIA and MAPIB. It interacts with the amino-terminal of MAPIB (By similarity).

J. Biol. Chem. 267:16561-16566 (1992).
-!- FUNCTION: Structural protein involved in the filamentous cross-bridging between microtubules and other skeletal elements.
-!- SUBUNIT: 3 different light chains, LC1, LC2 and LC3, can associate with MAPIA and MAPIB proteins.

V3 and Vint; are produced by alternative splicing.
TISSUE SPECIFICITY: Cerebral white matter. V0 and V1 is exprin normal brain, gliomas, medulloblastomas, schwannomas.

neurofibromas, and menningiomas; v2 is restricted and gliomas; v3 is found in all the DEVELOPMENT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DEVELOPMENTAL STAGE: Disappears after the cartilage development.
